

ROSS BOHLANDER

Indianapolis, IN

rbohlender@alumni.iu.edu

PROFESSIONAL SUMMARY

Software and data engineer with nearly six years of experience designing, deploying, and supporting production ETL pipelines, data integrations, automated workflows, and reporting systems. Owns 50+ business-critical processes that handle hundreds of files and thousands of transaction records daily. Combines Python and SQL expertise with CI/CD practices and cross-functional leadership to translate ambiguous requirements into maintainable software solutions.

WORK EXPERIENCE

Reams Asset Management | Indianapolis, IN

Software Engineer

December 2025 – Present

- Own and support 50+ production data pipelines, integrations, and reporting workflows serving approximately 150 portfolios and 20 investment professionals, including monitoring, incident response, and escalation for multiple business-critical systems.
- Design and optimize SQL Server and Python data solutions for multimillion-row workloads using reusable data models, stored procedures, table-valued functions, indexing, and execution-plan analysis, reducing major runtimes from several minutes to seconds.
- Deliver peer-reviewed changes through Git and Azure DevOps CI/CD across development, QA, and production, including unit and regression testing, UAT, deployment validation, release support, and recovery planning.
- Lead weekly Operations and investment-team planning for a four-person development team, prioritizing the backlog, scoping ambiguous requests, reviewing designs, mentoring peers, and translating stakeholder needs into maintainable solutions.

Application Developer

August 2020 – December 2025

- Built Python, Perl, and SQL ETL pipelines for ingestion, transformation, reconciliation, secure delivery, accounting-system imports, transaction processing, and reporting, processing hundreds of files and transaction records daily.
- Replaced manual and legacy Access workflows with controlled automation that eliminated several hours of daily operational work and fully automated multiple production processes.
- Developed cross-system integrations, data-quality controls, reusable portfolio calculations, and database-driven reporting that improved accuracy, reduced operational risk, and shortened monthly and quarterly reporting cycles from weeks to days.

PROFESSIONAL PROJECTS

Enterprise Accounting Platform Migration: Lead the ETL workstream for the firm's transition to a new accounting system by documenting legacy processes, producing source-to-target diagrams and sample files, refactoring production interfaces, and building reusable SQL functions that map warehouse data to the target platform's standards.

Futures and Options Fee Automation: Engineered an end-to-end workflow that ingests broker fee files, applies configurable fee and matching rules, stages and reconciles transactions in SQL, imports completed records into the accounting system, and generates automated trade tickets. Workflow eliminated repetitive manual fee entry, reduced processing time, and lowered the risk of inaccurate transaction records.

Commingled Fund Processing Automation: Replaced a legacy Access-based workflow with Python, Perl, and SQL automation for daily NAV ingestion, historical-data-based fund pricing, subscription and redemption activity, accounting imports, fee and trade-ticket outputs, and custodian-to-internal market-value reconciliation. Result centralized a fragmented process, eliminated routine manual handling, and improved the accuracy and auditability of daily fund processing.

Collateral and Margin Integration: Built file-generation, ingestion, and secure-transfer workflows for collateral positions, agreements, interest, margin, and payment instructions, along with SQL-based account and counterparty mappings and accounting-system integrations. This replaced manual preparation and review steps, reduced operational risk, and allowed staff to focus on exceptions rather than routine processing.

TECHNICAL SKILLS

Languages & Libraries: Python, SQL (T-SQL), pandas, Perl, shell scripting (C shell), JavaScript (BIRT scripting)

Database & Data Engineering: Microsoft SQL Server, Snowflake, dbt, ETL/ELT, data modeling, data warehousing, schema design, source-to-target mapping, staging-layer and historical data design, stored procedures, table-valued functions, indexing, execution-plan analysis, query optimization, data validation, reconciliation

AI-Assisted Development: GitHub Copilot; repository-wide workspace context, custom instruction files, reusable skills, planning-first development, dependency analysis, code generation and refactoring, test generation, and documentation support

Integration & File Processing: REST/SOAP API integration, SFTP, fixed-width and CSV processing, batch data interfaces, secure file delivery

Orchestration & DevOps: Control-M, cron, Windows Task Scheduler, Python-based job orchestration, Git, GitHub, Azure DevOps, CI/CD, Docker, Linux, Agile/Scrum

Testing & Reliability: Unit and regression testing, UAT, peer code review, release validation, logging, monitoring, alerting, incident response, root-cause analysis, retry and recovery logic

Reporting & Analytics: BIRT Report Designer, Matplotlib, Excel, Tableau, Power BI

EDUCATION

University of Iowa

Tippie School of Business

MBA / MSBA Dual Degree Program

- Concentrations: Finance and Machine Learning

Expected Graduation May 2029

Indiana University

Luddy School of Informatics & Computing

B.S. in Informatics

May 2020
