## PROFESSIONAL SUMMARY

Data engineer with six years of experience building and operating production ETL/ELT pipelines, financial data integrations, and reconciliation workflows at a $35B fixed-income asset manager.

## WORK EXPERIENCE

**Reams Asset Management** | Indianapolis, IN

***Software Engineer*** **December 2025 – Present**

- Own and support production data pipelines, integrations, and reporting workflows serving approximately 150 portfolios and 20 investment professionals, including monitoring, incident response, and escalation.
- **Accounting Platform Migration:** Lead the ETL workstream for the firm's move to a new accounting system, documenting legacy processes, producing source-to-target mappings and sample files, refactoring production interfaces, and building reusable SQL functions that map warehouse data to the target platform's standards.
- Design and optimize SQL Server and Python data solutions, including star-schema fact and dimension tables loaded daily and on demand and served through a view of precomputed results; tune stored procedures, table-valued functions, and indexes with execution-plan analysis, cutting key process runtimes from ~5 minutes to under 10 seconds.

***Application Developer*** **August 2020 – December 2025**

- Built Python, Perl, and SQL ETL pipelines for ingestion, transformation, reconciliation, secure delivery, accounting-system imports, and reporting across daily custodian, broker, and fund data feeds, with individual download jobs processing ~22,000 records each.
- **Commingled Fund Processing:** Replaced a legacy Access workflow with Python, Perl, and SQL automation for daily NAV ingestion, fund pricing, subscription and redemption activity, accounting imports, and custodian-to-internal market-value reconciliation, improving the accuracy and auditability of daily fund processing.
- **Futures and Options Fee Automation:** Engineered an end-to-end workflow that ingests broker fee files, applies configurable fee and matching rules, stages and reconciles transactions in SQL, imports completed records into the accounting system, and generates trade tickets, eliminating manual fee entry.
- Automated manual processing across operations workflows, eliminating ~3 hours of daily manual work and fully automating multiple production processes.

## PERSONAL PROJECTS

**Treasury Yield Curve** (BigQuery, dbt, GitHub Actions): scheduled ELT of daily Treasury yields since 1990. **Air Quality Dashboard** (DuckDB, dbt): daily OpenAQ-to-EPA AQI pipeline with a reusable dbt macro. **Squad Planner** (Snowflake, dbt, Python): ELT into Snowflake via PUT/COPY INTO with dbt marts.

## TECHNICAL SKILLS

**Data Engineering:** SQL Server, Snowflake, BigQuery, dbt, ETL/ELT, star schema, stored procedures, execution-plan tuning
**Languages:** Python (pandas), SQL (T-SQL), Perl, TypeScript, shell scripting
**Orchestration & DevOps:** Control-M, GitHub Actions, Git, Azure DevOps CI/CD, Docker, Linux, Claude Code, Copilot
**Integration, Testing & Reporting:** REST/SOAP APIs, SFTP, unit and regression testing, monitoring, Power BI, Tableau

## EDUCATION & CERTIFICATIONS

**University of Iowa, Tippie College of Business** | MBA / MSBA Dual Degree **Expected May 2029**
**Indiana University, Luddy School of Informatics & Computing** | B.S. in Informatics **May 2020**
**Snowflake Data Engineering Professional Certificate** | Snowflake **2026**
